

## ABSTRACT

A method for preventing a light guide plate from being distorted contains the following steps: providing a light guide plate (10) having two surfaces (12, 14); attaching protective films (20) on the two surfaces before processing; removing the films and forming a polymer coating (30) on the surface of the light guide plate which is not to be processed immediately before processing, the polymer coating being formed on the surface before further steps of processing. Before processing, the light guide plate is protected by the protective films, which isolate the light guide plate from moisture in the air. During processing, the light guide plate is protected by the polymer coating formed on the surface of the light guide plate, which is not to be processed, so that the light guide plate is prevented from distorting due to moisture absorption in the air. Therefore, the quality of the product is improved.
